

GERMAN-SERBIAN FORMULA FOR CANCER? (TRANSLATED FROM SERBIAN)

By: Ivona Zivkovic

What will surprise many is the fact that in Serbia also, of late, a successful formula against cancer is being applied, which has given very good results in clinical applications (*in vivo*) so far, while *in vitro* tests perplexed sceptical researchers at the Faculty of Medicine of Kragujevac (Serbia).

Primarily, Korbazol and Nakvonit formulas are in question. The principal formula is actually Korbazol, while in the therapy administered by the private Belgrade Hospital [Nova Vita](#) other formulas are also used, such as Amazonski Megamin, Imunark, Gonebazol, etc. These formulas have been developed and modelled for years in Germany and that was done by a group of geneticists and biochemists whose research was probably covered by the Bayer Company (since some of them worked for it). It is not known whether the powerful German concern abandoned further work on this preparation because it was not profitable or for some other reasons. In any case, like all large pharmaceutical firms, they "are still working" on cancer –related research.

But independent researchers continued what Bayer did not. Here too, according to some indications, some tried to prevent a formula against cancer from natural ingredients being put on the market, so it became only a supplementary nutritive formula. Official medicine ignores this formula and the name Korbazol is derived from the name (i.e. nickname) of one doctor Korb, who was a member of Bayer's research team. But since no inventor of a successful therapy in treating cancer was offered fame and money, but exclusively harassment, dismissal from work and threats – their names have remained a secret. Thus the creation of Korbazol is partly shrouded in mystery.

It goes without saying that the major "flaw" of this formula is that it is composed of common, natural substances (the main being Amazonian minerals, algae, grasses, pollen and propolis) and that it probably cannot be patented and profitably marketed.

It is only by dint of circumstance, the personal connections and obstinacy of a Belgrader (Milomir Kandić) that this formula found its way into Serbia, where in Belgrade's [Biofarm](#) (of which Kandić is a co-owner with German partners) they started manufacturing it, not as a cancer cure but as a nutrient immunity booster formula. Of course, a cure against cancer still officially – DOES NOT EXIST. But all those who have carefully read texts about cancer on this site know that cancer is in fact a chronic metabolic disorder.

It is precisely this metabolic therapy that the Nova Vita private hospital in Belgrade (in Rakovica), which is part of the German-Serbian Biofarm Company, started applying several years ago by means of the above formulas. As clinical treatment with the mentioned formulas demonstrated very good results in some types of cancer (but other illnesses as well) the [Nova Vita](#) Internal Medicine Hospital specialised in cancer over time. Believe it or not, there is neither surgery nor radiation there, but a specific immunotherapy applying the already mentioned natural formulas is administered. Regrettably, the largest number of patients so far started this type of treatment only after having exhausted all other methods of conventional "curing" and having been told by their doctors: "We have done everything in our power, but..."

Blood is a vital tissue and only a minor disorder in the manner of its functioning damages the feeding and work of all cells in the organism. To lose an arm or a leg is a lesser evil for the entire organism. A dark field microscopy image of red blood cells after conventional chemotherapy is shown in the above pictures. The small red circles are red blood cells. Healthy energy-replete red blood cells before chemotherapy are shown in the left picture and the same after chemotherapy are shown in the right one. Do you see the difference? Regrettably, most people subjected to chemotherapy do not know this.

A MAGIC OR A NATURAL FORMULA AGAINST CANCER?

Let us now dwell on the formula itself and the possible way in which it works. Let me remark that only one in-depth study has been undertaken so far by relevant scientific institutions in Serbia under laboratory conditions, while still no one from state institutions has shown serious interest in clinical testing (*in vivo*). But, for many cancer patients who came to Nova Vita as written-off cases and left it with their cancer symptoms subsided or completely gone, that is in fact not important.

Korbazol is a nutritive formula on the basis of propolis, pollen and honey (cancer thrives on sugar) which also contains a type of alga, a mixture of various grass grains and some fruits from the Amazon river valley (probably berries of the Brazilian acai palm), exceptionally rich in energy and minerals and which most probably contain some substances which have a lethal effect on cancer cells. Live cells suffer no consequences. It also contains the mineral zeolite, which has the extraordinary quality of absorbing toxins. The highest-grade zeolite in the world is precisely in Serbia in the area of northern Kosovo. According to some sparse information, the bombing of Serbia in 1991 by the NATO Alliance with depleted uranium, aimed at examining the effects of zeolite on neutralising radioactive particles in particular. Kosovo is rich in both uranium and zeolite. The precise formulas of Korbazol and Nakvonit are a business secret of the Biofarm Company. So is the Gonebazol formula (also manufactured by Biofarm) whose capacity of regenerating radiation-damaged cells has been scientifically tested. These tests were carried out by the "Vinča" Serbian Institute for Nuclear Sciences, but this formula is not the subject of this text.

In order for us to understand the possible way in which the Korbazol and Nakvonit formulas work, we have to examine the genesis of cancer in another way also. We shall also draw on the claims made in an interview ten years ago by German biologist and virologist [Dr. Stefan Lanka](#) who also studied the evolution of marine life forms.

Namely, one of the reasons why contemporary medicine is allegedly unable to understand the exact cause of the development of cancer, probably also lies in the fact that studies of medicine ignore the very phenomenon of the genesis of life. But, if we were to apply contemporary (hidden?) knowledge about that to the phenomenon of cancer we would reach the logical conclusion why various natural formulas used by alternative medicine become effective.

WHERE IS THE SOLUTION TO THE TREATMENT OF CANCER?

Life is [stored energy](#) which organised itself and functions on a principle which changes depending on the natural milieu (electromagnetic, chemical, thermal...). Only the particle of life – the protite (microzyma, somatid), as discovered and named by [Dr. Antoine Bechamp](#) – is eternal and indestructible. It fills the entire universe. Everything else changes. Thus, death also, as defined by contemporary medicine, is only a change of life form.

The large empty circles are red blood cells. The small white dots are the Protits. When they join together they form rods and cocci and... And every live form. The Protit is the smallest living thing, the God's particle of life.

When we speak about the human organism, it works on the principle of a functional endosymbiosis of trillions of cells (formed of protits) which exchange energy and information (genetic material) and practically work as a team. Every cell contains bacteria mitochondria. Man is thus a very complex colony of bacteria. Such colony is able to concentrate enormous quantity of bioenergy.

This complex symbiosis is today in harmony with the homeostatic principle which is sustained on Earth, the sole on which we can function in our present form. At this moment, the basic milieu for the life of people on Earth is a planetary homeostasis which maintains an optimal temperature between 15 and 35 degrees C, a quantity of salt in the sea of 3 – 4 %, a 21 % concentration of oxygen, ammonia which neutralises strong sulphuric acids, ozone which protects DNA molecules against ultra-violet radiation, etc. The particle of life – the protite – does not disappear with a change of these values, because it is indestructible, but only the symbiotic principle of energy maintaining and generating which prompts protites to group into different life forms changes.

Brain Cell

Mark Miller

The Universe

Viggo Cornelsen

Everything on Earth and the entire Universe are part of the same principle which always lives, bonds and creates: galaxies, stars, planets, bacteria, plants, animals... From the smallest to the largest all are infused with the same energy and the same principle of existence.

The photos show cosmic nebula (left) and mitochondria.

So, only what is part of nature and what the organism accepts as functional in maintaining what constitutes the fundament of life, namely the energy generating, can be involved in the natural symbiosis of the cells of the human organism (i.e. of the mitochondria in them). Any disruption in the energy supply or communication among cells can be rectified only if the organism successfully puts up a united front against it (by way of the immune system) and symbiosis continues functioning on the universal principle and at the optimum level of energy maintaining and generating.

Artificially created molecules of compounds created in chemical laboratories in scientific and research centres, which never bond in nature, have no place in this symbiosis. What has not been created in nature, such as synthetic drugs, for example, are a toxin to this symbiosis, which enter it by force and deceit, masked as part of symbiotic material. Its task is to destroy a process and thereby mitigate symptoms showing a functional mistake in the organism. No symptoms – no mistake. Modern allopathic medicine calls the elimination of symptoms "curing". If an organ fails due to lack of energy it is simply excised and removed. Conventional medicine today treats the living organism as a machine. Organ donation is profitable storage of "spare parts".

WHAT IS CANCER IN SUCH A SYMBIOSIS?

Dr. Stefan Lanka believes that primitive bacteria as monocellular organisms which existed on Earth before oxygen appeared in the atmosphere generated energy through a primitive process of fermentation. This yielded very small quantities of energy, insufficient for communication with other bacteria.

It is believed that the planets had not always been in their present-day array and it was only with a change of circumstances in the Solar System, when Earth assumed its present position in relation to the Sun, that this too was reflected on the functioning of bacteria. Namely, they thus started using photosynthesis, i.e. the energy of the Sun, in order to degrade matter and extract more electrons from it.

They learned to split water molecules and extract electrons, thus releasing oxygen. A consequence of this is that over time the atmosphere and water on the entire Earth became saturated with oxygen.

The next evolutionary step was, according to Lanka, when some bacteria learned to use oxygen in order to generate even more energy (by the oxidation of organic matter). They then built their own "furnace" as it were and could generate 20 to 30 times more energy from molecules of sugar than through the process of fermentation. In the process, oxygen sucked out many electrons from sugar molecules so they obtained much larger quantities of energy than they needed for simple division and sustenance of bacterial life. Then they were able to associate and form more complex colonial forms.

Different forms

of bacterial colonies

It is on this principle that bacteria called mitochondria work today, which are found in every single cell of our organisms and as a cellular battery store energy necessary for the work of each cell. They store energy in molecules called adenosine triphosphate (ATP).

Mitochondria generate energy the cell needs to be able to feed itself, differentiate into a specific type of cell, exchange genetic material with other cells and achieve a symbiosis which forms a complex organism.

Are all these forms of life only different forms of bacterial colonies and symbiosis?

Thus, the basis for the creation of complex symbioses was surplus energy and every cell in the human organism therefore has to produce a specific quantity of energy (from 29 to 38 molecules of ATP from one molecule of glucose). All this take place at a 21% concentration of oxygen in the atmosphere.

The mitochondria in the cell and a diagram of the complex process of the chain transport of electrons believed to be taking place in it

But, if the quantity of oxygen transported by the blood for some reason becomes smaller and

insufficient for this cellular "furnace" which must be "stoked" in order to be able to extract nutritive molecules – a problem arises. This cellular battery is left without sufficient energy for proper nutrition and communication.

The cell then either dies or feverishly strives to survive by reverting to the way a simple monocellular organism feeds – and that is fermentation. Then it no longer uses oxygen, but becomes anaerobic and generates very little energy (1 to 2 ATP molecules from one molecule of glucose). Since it has no surplus energy, it is unable to communicate with other cells but can only divide and thus continues to live by itself. That is a cancer cell as described by Nobel laureate Otto Warburg back in 1940.

Therefore, cancer is not a foreign body in the organism, but part of a complex symbiosis with cells which are no longer able to fit into a multicellular community which uses oxygen, but which have become anaerobic.

Cancer, therefore, does not have characteristic symptoms as is the case with the effects of toxins on the organism, but is a process which goes on undetected for years until a non-functional tissue which becomes noticeable develops.

THE PROBLEM OF THE STEM CELL DUE TO LACK OF ENERGY

Cancer in fact originates in parts of tissue where a cell has sustained permanent damage. These cells then need to be replaced by "universal" cells which have not differentiated during embryonic development, but have permanently remained "captive" at the embryonic stage. These are stem cells. They are activated and transformed into a specific type of cell when necessary. For instance, when a bone is fractured, universal cells from bone marrow transform themselves into bone cells and regenerate damaged bone tissue. Thus the bone heals. If such a stem cell is instructed to transform itself into a bone cell and is unable to generate enough energy to do the job, it will frantically attempt to transform into a bone cell but will not manage to do so for lack of energy. Thus, if it does not die, it remains living as an anaerobic monocellular organism (because the particle of life is indestructible), constantly multiplying as a bacterium. Unable to achieve energy communication with other cells, it does not get the message when it should stop multiplying.

This was established as far back as in 1902 by the Scottish doctor [John Beard](#).

Dr. Stefan Lanka claims that because of that a cancer cell has only embryonic markers on its surface, so testing for different cancer markers is only a profitable business and is of no bearing on the early detection of cancer.

Dr Stefan Lanka

In its attempts to differentiate a cancer cell eventually loses part of its genetic material, which was once considered to be the cause of cancer. However, according to recent findings also supported by Dr. Lanka, the process is set in motion by the lack of oxygen.

There are different reasons why the supply of oxygen to a cell can be stopped: if the blood has been oxidised by the intake of nitrites (which are contained in numerous stimulants, including the famous Viagra), or sulphonamides (the popular Bactrim being one) or if heavy metals appear on the path between blood and the cell (introduced via vaccines). The lack of fatty acids in nutrition (Omega 3) can also prevent cellular oxygen intake, as can radiation. A problem is also an energy decline in all mitochondria in the cell due to a lack of micronutrients serving to "stoke" the cellular "furnace", or the excessive use of antibiotics.

From the above we may conclude that the treatment of this disorder is possible only when a natural substance is introduced into the complex cellular symbiosis, which it will receive and which will by way of oxygen introduce electrons into the cancer cell, stoke "the furnace" in the mitochondria and with this additional energy help it achieve communication with other cells. The immune system will then successfully activate the process of apoptosis (programmed death) of cancer cells.

HOW EFFICIENT IS KORBAZOL?

Theoretically, this could be the way in which the Korbazol and Nakvonit formulas work. Electrons are transported by the minerals which this formula abounds in, but also one species of Amazon algae (proteins of algae have an exceptional symbiotic ability), while Amazonian pollen and

propolis are the bait with which psychotoxic molecules from other plants will also enter the cancer cell and which will induce it to apoptosis. The zeolite will pick up the toxins which may have prevented the supply of oxygen to the cancer cell.

In contrast to this explanation in lay terms, contemporary science has given all chemical processes and every single fragment of protein seen under huge electronic microscopes precise names, and is given to scientifically interpreting everything in such terms. In that way the effects of this formula were tested for a year at the Institute for Microbiology and Immunology of the Faculty of Medicine in Kragujevac in Serbia. Although initially they refused to engage in this research, for as they themselves said: "...doctors have reservations towards everything coming from the world which is not based on facts known to them", they accepted to do the analysis because of the curiosity of individuals from this institution.

Thus, this [expert study](#) reached the conclusion that: **"Nakvonit and Korbazol have a selective cytotoxic effect and the cytotoxic effect increases with the increase of the dose of tested substances and the time of incubation"**.

They have also discovered that the mentioned formulas activate specific caspases (-2, -4 and -3). Caspases is the biological term for enzymes which as mediators participate in cellular apoptosis.

As we have seen that an oxygen deficit, according to Dr. Warburg, is the main factor in the development of cancer, the third conclusion of the research in Kragujevac is particularly interesting. It reveals that: "Nakvonit and Korbazol increase the concentration of malonildialdehydes and hydrogen peroxide by inhibiting (stopping) superoxide dismutase and glutation peroxidase".

Superoxide dismutase and glutation peroxidase are antioxidants. Hydrogen peroxide (H₂O₂) has one atom of oxygen more than water. Malondialdehyde is a biomarker for oxidative stress.

Simply speaking, **these formulas evidently open the way to a larger number of oxygen atoms into a cancer cell as well as to a larger number of free radicals where they produce oxidative stress which triggers the complex mechanism which leads the cell into apoptosis.**

The percentage of malignant cells killed in this way (*in vitro*) is from 60 to 90 over 24 hours, **which depends on the concentration of substances in the formula and the type of the malignant cells. For these researchers, Korbazol and Nakvonit are currently the strongest known natural cytostatic.**

Serious clinical testing in Serbia could in this case be very intriguing, but the powerful medical establishment (which imposes chemotherapy, radiation and surgery) probably wishes to avoid it.

Nevertheless, word of these successful formulas spread, so that Americans, Italians, Romanians, Hungarians, Arabs and, most interesting of all, doctors themselves, also became patients.

Dr Albu Zaruba

Part One

Part Two

The formula has not so far proven very successful in the treatment of bone and brain cancer.
